**Warning:**

This document was copied as is from the Cocoon 2.1 documentation, but has not yet been fully reviewed or moved to its new home.

## 1. Fragment Extractor Generator

FragmentExtractor is a transformer-generator pair which is designed to allow sitemap managers to extract certain nodes from a SAX stream and move them into a separate pipeline. The main use for this is to extract inline SVG images and serve them up through a separate pipeline, usually serializing them to PNG or JPEG format first.

- Name : extractor
- Class: org.apache.cocoon.generation.FragmentExtractorGenerator
- Cacheable: no.

<map:generate type="extractor"/>
