**Warning:**

This document was copied as is from the Cocoon 2.1 documentation, but has not yet been fully reviewed or moved to its new home.

## 1. Log Transformer

This transformation's main purpose is debugging. The LogTransformer is a class that can be plugged into a pipeline to print the SAX events which pass through this transformer in a readable form to a file.

The file will be specified in a parameter tag in the sitemap pipeline to the transformer as follows:

```
<map:transform type="log"> <map:parameter name="logfile" value="logfile.log"/>
<map:parameter name="append" value="no"/> </map:transform>
```

Because the log file will be hardcoded into the sitemap this LOGTransformer will not be thread safe! If you don't specify the logfile the output is sent to the standard output of your servlet engine.

- Name : log
- Class: org.apache.cocoon.transformation.LogTransformer
- Cacheable: no.
